

# Rexx Programming Style

Phil Smith III, Micro Focus International

Do you capitalize your Rexx? Just variables? Just keywords? Do you indent your Rexx? How much? When? How do you get the first 'n' characters of a string? SUBSTR? PARSE? LEFT? If you have ever debated these or other questions, this presentation is for you!

Programming style is an emotional issue for many programmers. With its great power and flexibility, Rexx programming style is particularly controversial. This presentation will define what programming style is and is not. The speaker will discuss the issues, including choices subject to personal preference and those often perceived as stylistic, but which are dictated by performance, maintainability, or functional considerations.
